

## Cryo 21

Adipose tissue or fat is a term for loose connective tissue composed of adipocytes. Its role is to store energy in the form of fat and also cushions and insulates.

This treatment will help to achieve tone and definition. It works by creating a thermal shock to permanently remove the fat cells via a process called 'apoptosis'.

The body naturally does this all the time. With Cryo we speed this process to get immediate results.

Fat cell reduction is eliminated by the human body through the liver, the gastrointestinal tract and the lymphatic system in the next 14 to 20 days.

(Fat Freeze can only be every 2 weeks) All the other treatments are arranged by your consultant.

Courses and costs are designed for your individual plans

Let us help you.
